StrawNet

PELLETIZED STRAW™ MULCH

THE ALL-NATURAL
Lawn Repair Solution

JUST ADD
Water!

Fix the bare spots in
your lawn with natural
straw fibers in a convenient
and effective pellet.

- Maintain Soil Moisture
During Germination
- Won't Blow Away!
- Weed-Free Product

Net Weight 10 lbs. (4.52 kg) – Covers Up To 100 Square Feet

INTRODUCING THE EVOLUTION OF STRAW

For years, straw has been used to maintain soil moisture during germination. And, for years, straw has been blown-away or washed-out leaving soil exposed. Not anymore! Our compressed straw fibers are formed into easily applied pellets that weigh more than straw so they can't be blown around. Add water, and the pellets swell and rupture forming a thin moisture trapping net of straw fiber. This layer will provide a barrier from evaporation while still allowing water to infiltrate for ideal seed germination. StrawNet...everything straw does and a whole lot more!

STAGE 1
Just applied, no irrigation or rain
- still in pellet form.

STAGE 2
After light rain or irrigation
- partially ruptured pellets.

STAGE 3
After several rains or irrigations
- completely ruptured pellets.

Prevents Blow-Off

Because StrawNet has eight times greater bulk density than conventional straw the blowing problems related to straw are completely eliminated. Plus, special binding agents have been added to StrawNet to actually net the straw fibers together. This netting effect not only bonds the straw with itself but with the soil surface below forming a moisture absorbing barrier between the soil and environment.

Captures Moisture

Unlike conventional straw, StrawNet can hold up to four times its weight in moisture. This ability to hold moisture helps increase water infiltration and reduce water run-off. Maintaining moisture at the surface where the seed resides during germination is the key to successful seed establishment. StrawNet's ability to trap and hold moisture can improve any seeding project's success.

Ease of Application: 5 Easy Steps

Being in the pelletized form, StrawNet can be applied easily in any number of ways. For small spot repairs StrawNet can be applied directly by hand with no mess. For seeding projects of a few thousand feet or more, a walk behind mulch spreader should do the trick.

1 Loosen soil in repair area 2 - 3" in depth. It's important to have a good seed bed.

2 Spread seed at the recommended rate of the manufacturer.

3 Apply StrawNet to the area covering approx. 50% of the soil. Refer to the Stage 1 photo above reference.

4 Watering is key! Water the area 2 times daily for about 3 weeks or until the area is grown-in.

5 For best results apply a starter fertilizer to the area 2 weeks after the seed germinates.

StrawNet is a Weed-Free Product!

The pelletizing process of StrawNet involves high temperatures that kill undesirable seeds that may be mixed in conventional straw.
