

Come Hell or

High Water,

We've got you

Covered

Now Green! StrawNet... all the performance of straw in an easy to apply, easy to store pellet.

For years straw has been used to help maintain soil moisture during germination. And for years straw being blown-away or washed-out leaving areas of soil exposed has been a problem. Those days are over with the introduction of StrawNet, the Pelletized Straw Mulch. It's simple. Compressed straw fibers are formed into easily applied pellets that weigh more

than conventional straw so they can't be blown around. Add water and the pellets swell and rupture forming a thin but dense ground cover. Special binding agents have been added during production to help the straw fibers net together

with themselves and the soil creating a moisture trapping layer of straw fiber. This layer will provide a barrier from wind and evaporation while allowing water to infiltrate for ideal seed germination. Introducing StrawNet Pelletized Straw Mulch... it's not your typical straw! For more information contact a distributor near you or visit www.StrawNet.com
